

Week 1 — Netflix Clone Project: Practice Exercises

Build the Netflix clone project by following the Week 1 guided video sequence step by step.

Recreate the project in your own workspace and implement each feature in the same order shown in the video lessons.

Prepare and use the required resource files for the Netflix clone project. Download the official resource package from Week 1 and use the included images and design references where required in the videos.

Complete the project by following all videos in order, then verify your final result using the completion criteria.

Hint on homework folder organization

- **Suggested folder layout (initial setup):** Create a simple chain so everything for Phase 4 Week 1 stays in one place, for example:
 - `Evangadi/phase-4/week-1/netflix-clone/` — your **Vite/React project** (the app you run with `npm run dev`)
 - `Evangadi/phase-4/week-1/resources/` — **unzipped** resource files (images, designs, helper files from the zip)

You can use slightly different names, but keep **project code** and **downloaded resources** as **siblings** under the same `week-1` folder so paths and backups stay easy.
- Keep your source files, resource assets, and `.env` file organized and easy to locate.
- Do not skip directly to final code; code along while watching each video.
- Resolve errors immediately before moving to the next section.

Build instructions

- In your course dashboard, open **Phase 4 → Week 1: Introduction to AI-Powered Application Development**.
- Expand **Project Videos: Netflix Clone**.
- Start from **Video 1** and continue in exact order through **Video 9**:

- i. Project overview and setup
 - ii. Building Header Component
 - iii. Building Banner Component
 - iv. Building card Component
 - v. Building Row and Slider Component
 - vi. API integration
 - vii. Building Footer Component
 - viii. Deployment
 - ix. Possible AI Integration
- Code along while watching.
 - Complete each video segment before moving to the next one.

Resource setup instructions

- Download **Resource files for Netflix project** from Week 1, or use:
[Download resource files here](#)
- Unzip the package and use the included images and design references where the videos require them.
- Keep your project organized (source files, assets, and environment file).
- When an error appears, resolve it immediately (imports, paths, CSS class names, API setup, environment variables).

Completion checklist

By the end of Week 1, your project should demonstrate:

- A working Netflix clone project layout with header, banner, rows/cards, and footer
- Styling that follows the provided design references
- Successful movie/API integration as shown in the lessons
- Clean project structure and runnable local setup

Happy coding 😊 .
